

IPL Project Annual Report 2016

January 2016 to 31 December 2016

- 1 Project Title: Development of Community-based Landslide Early Warning System in Indonesia (IPL 158)
- 2 Main Project Fields: Monitoring and Early Warning and conducted in conjunction with IPL Project no IPL-140, IPL-159 and IPL-165.
- 3 Name of Project leader:
Dr. Teuku Faisal Fathani :
Department of Civil and Environment Engineering, Universitas Gadjah Mada, Indonesia
Contact: Jl. Grafika no. 2, Yogyakarta 55281, Indonesia
Phone : +62-274-562232 and Fax : +62-274-562232 Email : tfathani@ugm.ac.id

Core members of the Project: Names/Affiliations: (4 individuals maximum)

- a. Prof. Dwikorita Karnawati: Geological Engineering Department, Faculty of Engineering, Universitas Gadjah Mada, Indonesia (dwiko@ugm.ac.id)
 - b. Dr. Wahyu Wilopo: Geological Engineering Department, Faculty of Engineering, Universitas Gadjah Mada, Indonesia (wwilopo@gmail.com)
 - c. Mr. B. Wisnu Widjaya: Deputy for Prevention and Preparedness, National Disaster Management Agency (BNPB), Indonesia
 - d. Mr. Medi Herlianto: Director for Preparedness, National Disaster Management Agency (BNPB), Indonesia
- 4 Objectives: (5 lines maximum)
 - Community empowerment with respect to community-based disaster risk reduction in landslide vulnerable areas, by integrating technical and social system.
 - Improvement of awareness, preparedness, and resilience of the community in facing disasters in order to create a resilient village, which is at the root of the nation's resilience.
 - 5 Study Area: (2 lines maximum): at 60 districts located in Java, Sumatera, Sulawesi, Bali and Papua Islands of Indonesia.
 - 6 Project Duration (1 line maximum) : 2009 - 2017

7 Report

- 1) Progress in the project: (30 lines maximum)

The community-based landslide monitoring and early warning system (EWS) has been developed in Indonesia since 2007. Since then, this research project is supported by ICL. This activity is monitored and evaluated annually, in order to provide a solution for the problem faced during its implementation. The coordination between the government, university, private company and the community plays an important role for the effectiveness and sustainability of this program. A strategic approach for landslide disaster risk reduction is developed through the promotion of monitoring and information flow and command system.

Several monitoring devices and warning services were developed involving a simple and low cost equipment up to high technology by using a telemetry system for data transfer. The monitoring devices comprise the sensor to measure rainfall intensity, surface deformation, slip surface deformation and pore water fluctuation in the sliding mass. These devices provide an online monitoring and could be accessed in a webserver. This system can be adjusted depending on the site conditions.

On January-December 2016, the landslide EWS were implemented in 60 districts at 5 islands namely Java, Sumatera, Sulawesi, Bali and Papua, with the financial support from National Disaster Management Agency (BNPB). A landslide evacuation drill was carried out as an effort to establish a ready community in facing disasters. The simulation was a training for the Disaster Preparedness Team and was carried out following the Standard Operating Procedure and evacuation map.

2) Planned future activities or Statement of completion of the Project (15 lines maximum)

This landslide monitoring and early warning devices will be further developed, by implementing them in several pilot site including in Papua and Kalimantan Islands in Indonesia and in Timor Leste, and evaluate their technical performance as well as the impact to the community. Results of the evaluations will be used to facilitate the enhancement of the system performance. In 2017, National Disaster Management Agency (BNPB) and District Disaster Management Agency (BPBD) will support the implementation of landslide EWS at another 24 prone districts in Indonesia.

3) Beneficiaries of Project for Science, Education and/or Society (15 lines maximum)

Various potential beneficiaries of the project may be achieved including strengthened international partnership and good cooperation among related institutions. Besides the integration of this monitoring and warning system is very important. This because of several institutions might have their own system, but not yet integrated with the other monitoring system. A national framework needs to be promoted to coordinate all of landslide monitoring systems in Indonesia. By this integration, the landslide monitoring and early warning system at national-provincial-district level could be enhanced and could work properly.

4) Results: (15 line maximum, e.g. publications)

Research papers published in journals or presented at conferences
